

INQUA Peribaltic 2015 Working group meeting & International field symposium

Quaternary Geology and Modern Questions

FIELD GUIDE

Part 1

Utrecht – Texel – Assen

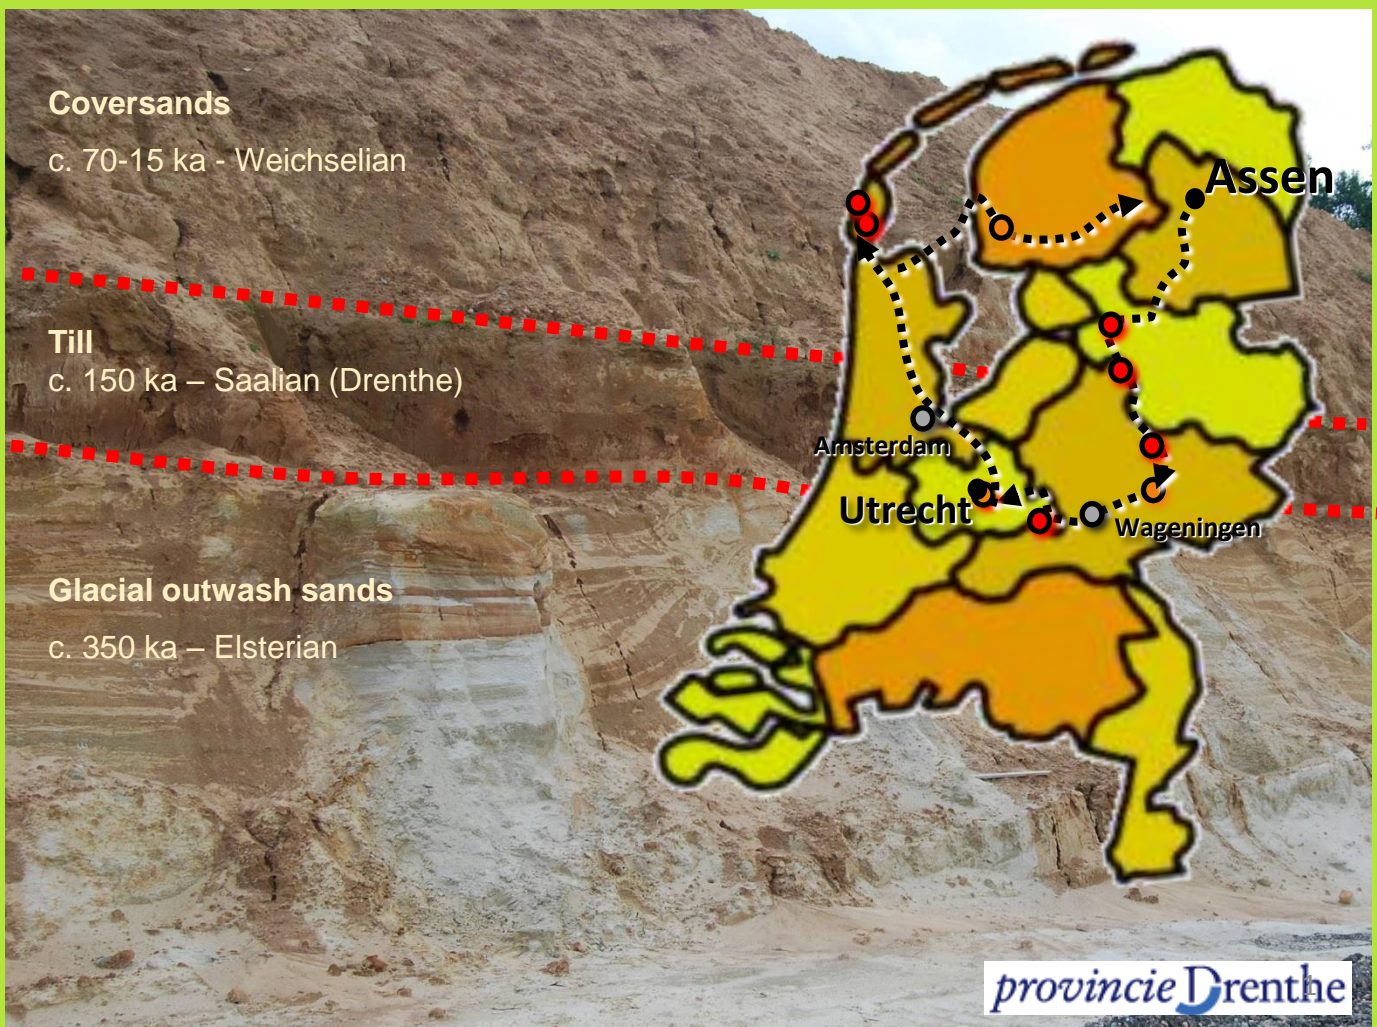

Tue 3 November

Assen – IJssel Valley – Utrecht

Fri 6 November

The Netherlands | November 2 – 8, 2015 | Utrecht – Assen - Utrecht

Program

Information:

in this guide

in other guide(s)

Mon 2 November - Arrival in Utrecht *icebreaker*

Tue 3 November - Fieldtrip Utrecht – Texel – Assen

Check-out Utrecht Hotel – Check-in Assen Hotel

Visit NIOZ institute. Coastal Stop at Slufter Texel.

Diner at Workum, halfway between Texel and Assen, before check-in

Wed 4 November - Fieldtrip Assen – Drenthe – Assen

Thu 5 November - Conference day Assen

Fri 6 November - Fieldtrip Assen – IJssel – Utrecht

Check-out Assen Hotel – Check-in Utrecht Hotel

Visit Wageningen Univ., glacial and fluvial stops IJssel + Rhine.

Diner at Utrecht, walking distance of hotel, after check-in

Sat 7 November - Visit TNO Geological Survey NL

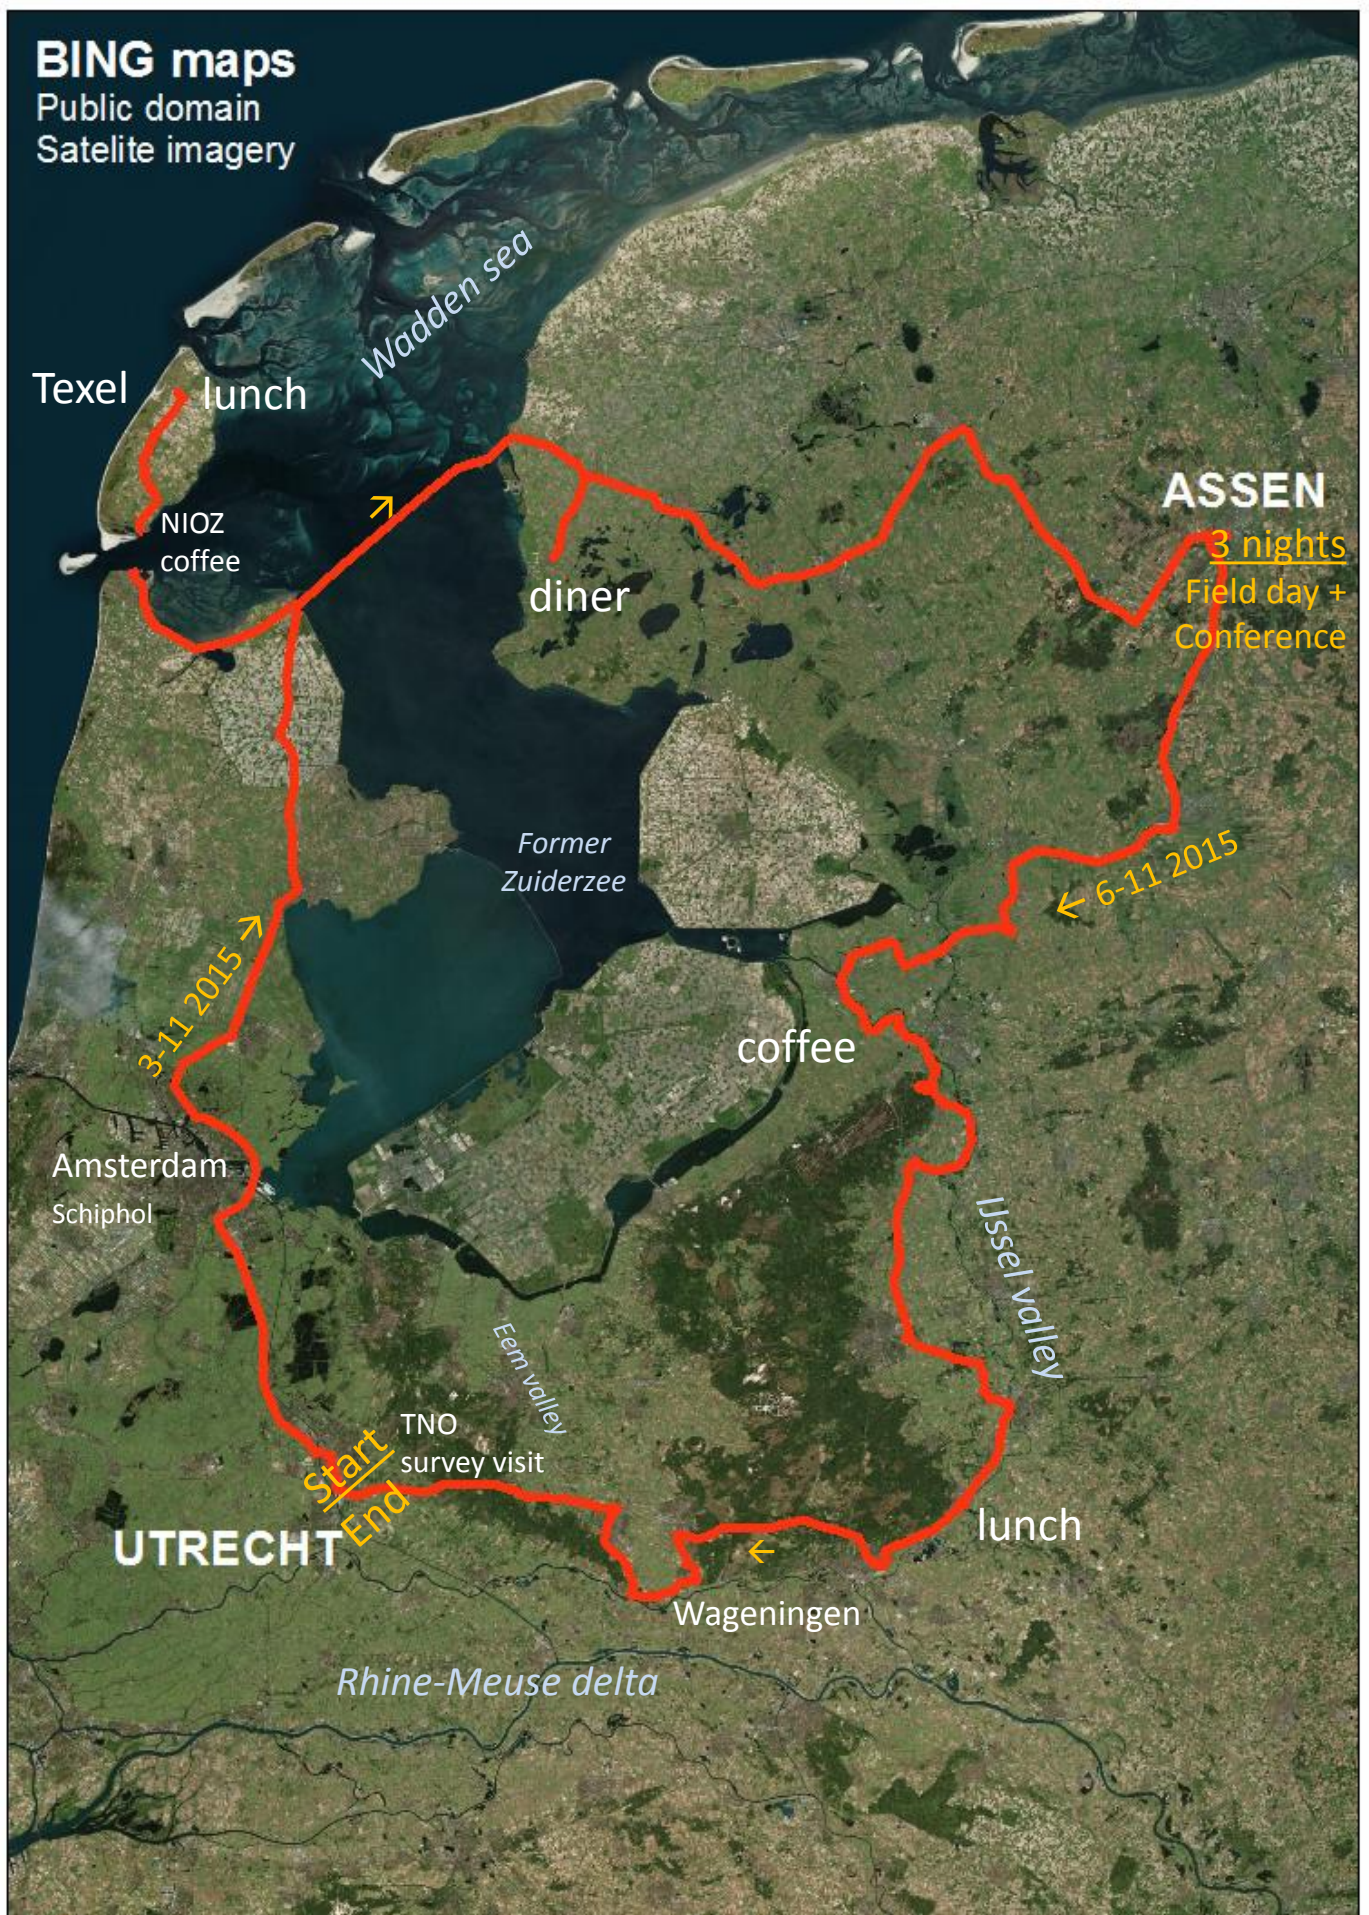

Sun 8 November - Departure from Utrecht

This guide: Cohen, K.M. & Busschers, F.S. (2015) INQUA Peribaltic 2015 Working group meeting & international field symposium (2-7 Nov. 2015) Field guide Part 1. Utrecht University, TNO Geological Survey of the Netherlands, Province of Drenthe. Utrecht/Assen (The Netherlands) - 54 pp.

NIOZ

marine research institute

20 minutes

Mainland Holland

(Den Helder)

Prof. Dr. Ir. Jaap S. Sinninghe Damsté

Prof. Damste (NIOZ, UU) holds a chair in Organic Geochemistry and is one of the Netherlands most prolific geoscientists. He works on all organic components (biomarkers) in the marine sedimentary and fossil record: the full myriad of organic molecules derived from marine (algae, (cyano)bacteria, archae) and terrestrial organisms living at the time of deposition. These biomarkers contain information in past climatic and palaeo-environmental changes. Their contained information is used (i) to improve understanding natural and anthropogenic influences on present-day climates and depositional systems, and (ii) to deciphering the conditions which have led to sequestration of organic carbon in the geological record. His talk contribution during our stop at NIOZ will be on:

Marine organic geochemistry of the Baltic Sea: temperature reconstruction through the Holocene

The talk is precluded by an introductory movie of the NIOZ institute, its mission and its research vessel Pelagia.

NIOZ institute history

www.nioz.nl

The history of the institute and its marine field research began in 1872 with the founding of the Dutch Zoological Society. The Society owned a dismountable building that was used as a field station until 1890. In general, no more than five people were at work here, including the first directors who would carry out their research unsalaried. In 1877 the building was stationed in the city of Vlissingen. From here, a schooner departed for a first scientific cruise to the English coast and Helgoland. From 1931 onward, the Dutch government financially supported the Zoological Station, which significantly strengthened its ties with the biological faculties of universities by organizing student courses. The economic crisis however set a limit to the expansion with additional staff. After World War II, the workforce expanded with researchers on temporary positions. In 1957, director Verweij submitted a proposal to widen the scope from biology to chemistry, physics and geology, which was instantly approved. In 1960 the Zoological Station was renamed the 'Netherlands Institute for Sea Research' and a year later the first issue of Netherlands Journal for Sea Research was released.

The institute expanded and soon appeared too small to accommodate some 150 employees. Besides, the potential for intake of sea water in Den Helder was too limited. In 1969 the NIOZ moved to the 'provisorium' a temporary housing in polder 't Horntje at the Frisian island of Texel and only in 1977 the new building was opened. Since 1990, NIOZ is part of NWO and has been disincorporated from the Dutch Zoological Society. As per 1st of January 2012, NIOZ has merged with the former NIOO-CEME (Centre for Estuarine Marine Ecology) in Yerseke. The institute now has two locations, one on the Island of Texel at the border between the North Sea and the Wadden Sea, and about 100 km north of Amsterdam, and one in Yerseke, southwest Netherlands, in the delta area, some 150 SW of Amsterdam.

Semi-natural vegetation and natural beach and channel dynamics ... but human-managed limits to what the channel is allowed, and from time to time the channel mouth is repositioned.

Prof. Dr. A.P. (Ab) Grootjans

Prof. Grootjans holds a chair in Ecohydrology of Wetlands at the University of Groningen and at Radboud University Nijmegen. His expertise is on ecohydrological approaches to nature conservation and restoration ecology. His research is carried out on the landscape and the habitat scales, with focus on the relationships of wet ecosystems with the hydrological cycle on the landscape level. Prime research areas are mires, peatlands and coastal wetlands. The former have been studied in Poland, Slovakia, Latvia, South-Africa, Tierra del Fuego (Argentina) and The Netherlands. The latter in The Netherlands, England, South Africa and West-Australia.

Prof. Grootjans will guide us during a

TNO Geological survey of the Netherlands visit

The Geological Survey of the Netherlands

The Netherlands' national Geological Survey is part of TNO (Netherlands Organization for Applied Scientific Research), an independent national research and technology institute. The Survey operates in a densely populated and intensely used area. Over 60% of the country's shallow subsurface consists of fluvial and coastal lowland sediments. The rest consists mostly of Pleistocene fluvial and glacially-modified basin fill terrains.

Flooding of the lowlands is a strong natural hazard, in places increased owing to land-subsidence following human interferences (water-table lowering, extraction of gas and salt). Not particularly hazardous but significant in terms of costs and financial risks is building on young and soft coastal plain soils. Hereto high resolution data and mapping of the heterogeneous fluvial and coastal deposits is needed. The mission of the Netherlands' Geological Survey thus reads:

To provide geoscientific data, information and knowledge

- for sustainable management of Earth resources and the environment in general; and
- to reduce societal costs and risks associated with geohazards and adverse ground conditions.

time	Talk
10.00	Coffee and cookies <i>Leave the hotel around 9.30. Travel with bus 28</i>
10.30	Introduction Geological Survey of the Netherlands (Michiel van der Meulen)
11.00	GeoTOP voxel modelling: data & methods (Freek Busschers)
11.20	3D demo GeoTOP voxel model (Freek Busschers)
11.45	Visit to core processing facility (Ronald Harting)
12.30	Lunch
13:30	End of TNO-GDN visit

The survey activities are conducted under a single government funded programme, the main elements of which are data management (e.g. borehole handling workflow, quality assurance, public exposure) and geomodelling (2D/layer models, 3D/voxel models). A database (DINO) and a legislation-supported national register (BRO) for digital subsurface data the Survey's main assets.

The survey invests in communication, in maintaining a knowledge base and in scientific publication. We cooperate with other surveys, research institutes and universities; nationally and internationally.
