

General aspects of stable isotopes and IRMS

definitions, use, measurement principles

Prof. Ivo Leito

Isotopes

- **What are Isotopes?**

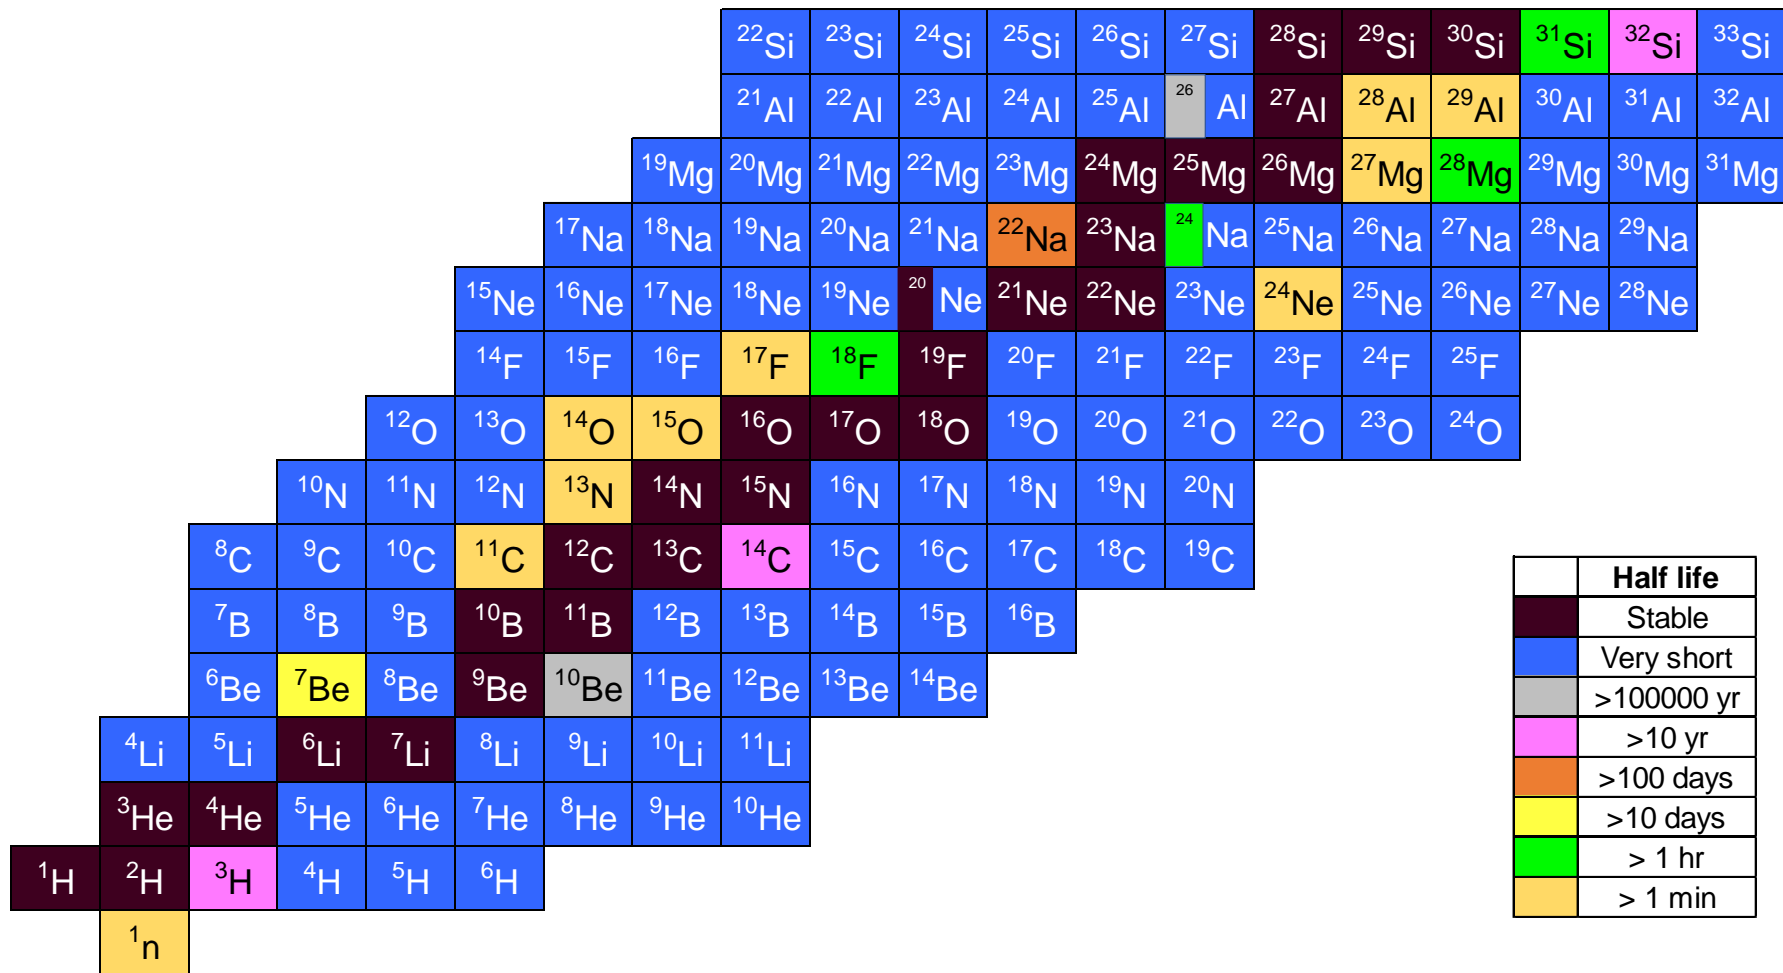

- Atoms of the same element (i.e., same number of protons and electrons) but different numbers of neutrons

- **What is a Stable Isotope?**

- isotope(s) of an element that do not undergo radioactive decay, but they may be radiogenic (i.e., produced by radioactive decay)

Isotopes of light elements

		Half life										
		Stable										
		Very short										
		>100000 yr										
		>10 yr										
		>100 days										
		>10 days										
		>1 hr										
		>1 min										

Isotopes of elements

- **Symmetry rule:** neutron-to-proton ratio (N/Z) of stable isotopes in light elements equals approximately to unity
- In elements with **Z or $N > 20$** the N/Z ratio is always greater than unity, **up to 1.5** for the heaviest stable nuclei
- To maintain the stability in the nuclei more neutrons than protons are required in progressively heavier elements

Elements according to the half-life of their most stable isotope

		Group																				
		I	II											III	IV	V	VI	VII	VIII			
Period	1	1 H																				2 He
	2	3 Li	4 Be											5 B	6 C	7 N	8 O	9 F	10 Ne			
	3	11 Na	12 Mg											13 Al	14 Si	15 P	16 S	17 Cl	18 Ar			
	4	19 K	20 Ca	21 Sc	22 Ti	23 V	24 Cr	25 Mn	26 Fe	27 Co	28 Ni	29 Cu	30 Zn	31 Ga	32 Ge	33 As	34 Se	35 Br	36 Kr			
	5	37 Rb	38 Sr	39 Y	40 Zr	41 Nb	42 Mo	43 Tc	44 Ru	45 Rh	46 Pd	47 Ag	48 Cd	49 In	50 Sn	51 Sb	52 Te	53 I	54 Xe			
	6	55 Cs	56 Ba	*	72 Hf	73 Ta	74 W	75 Re	76 Os	77 Ir	78 Pt	79 Au	80 Hg	81 Tl	82 Pb	83 Bi	84 Po	85 At	86 Rn			
	7	87 Fr	88 Ra	**	104 Rf	105 Db	106 Sg	107 Bh	108 Hs	109 Mt	110 Ds	111 Rg	112 Cn	113 Nh	114 Fl	115 Mc	116 Lv	117 Ts	118 Og			

* Lanthanides	57 La	58 Ce	59 Pr	60 Nd	61 Pm	62 Sm	63 Eu	64 Gd	65 Tb	66 Dy	67 Ho	68 Er	69 Tm	70 Yb	71 Lu
** Actinides	89 Ac	90 Th	91 Pa	92 U	93 Np	94 Pu	95 Am	96 Cm	97 Bk	98 Cf	99 Es	100 Fm	101 Md	102 No	103 Lr

	at least one stable isotope
	half-life of over two million years
	half-life between 800 and 34,000 years
	half-life between one day and 130 years
	half-life between several minutes and one day
	half-life less than several minutes

Isotopic abundances

- Natural elements are mostly **mixtures of isotopes**
- Example: **standard** natural stable **C**
 - Abundances: 98.89 % is ^{12}C ; 1.11 % is ^{13}C
 - **Depending on origin** the ^{13}C content can vary markedly: ca 1.00 .. 1.12 %

δ scale

- Isotope abundance ratios in real samples, e.g. $^{13}\text{C}/^{12}\text{C}$ ratio in charcoal, are expressed relative to international standard in the **$\delta^{13}\text{C}$ scale**:

$$\%^{13}\text{C} = 1.11\% \rightarrow \delta^{13}\text{C} = 0$$

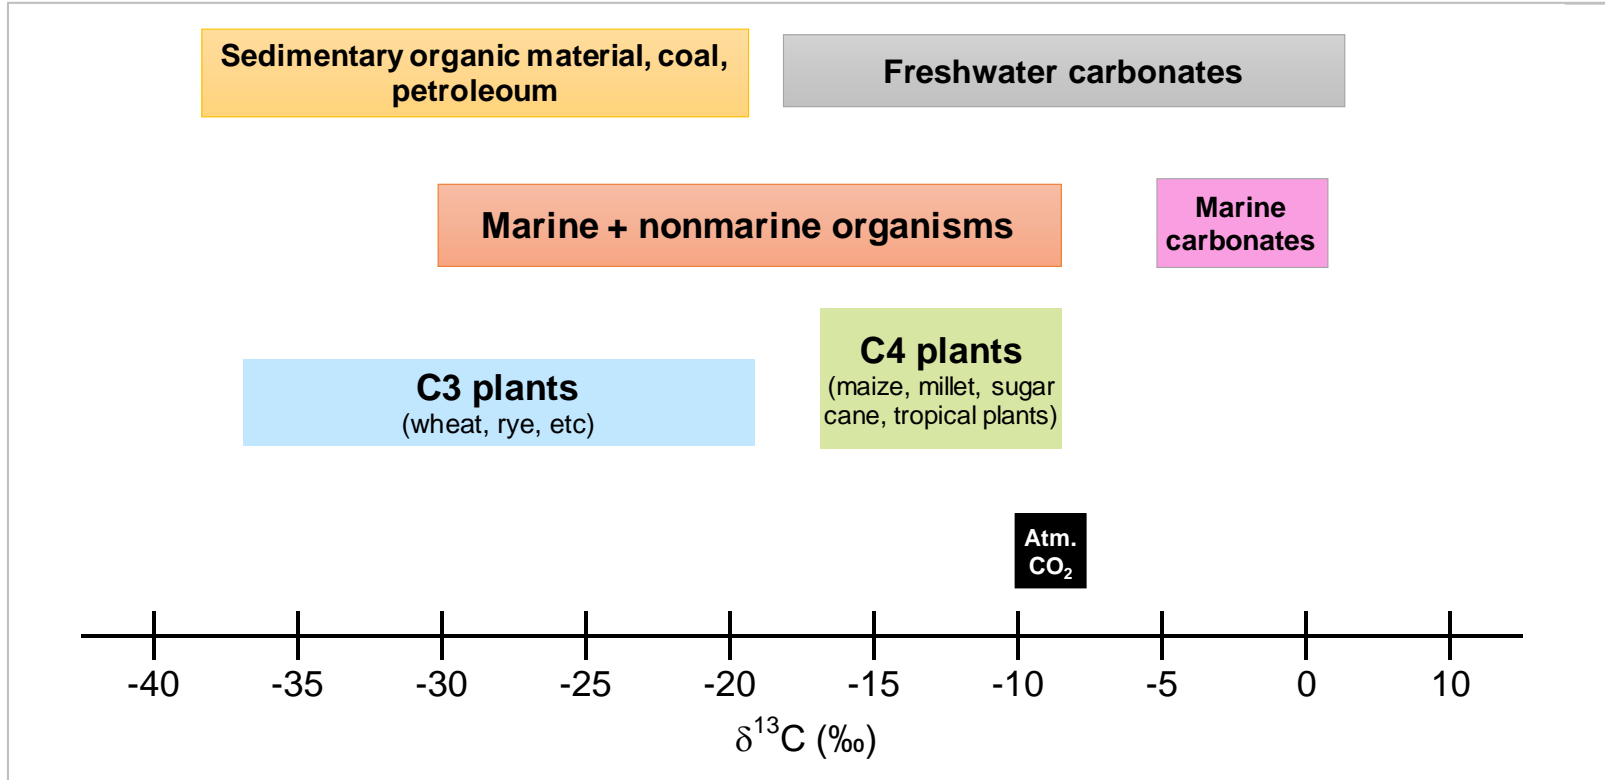

$$\%^{13}\text{C} = 1.06\% \rightarrow \delta^{13}\text{C} = -44$$

$$\delta = \left(\frac{R_x}{R_{std}} - 1 \right) \times 1000$$

Isotope Fractionation

- Isotopes of an element undergo the same chemical reactions and physical processes
- **Differences in mass** can influence the **rate** or extent of
 - **physical** processes (e.g. evaporation)
 - **chemical** reactions (e.g. photosynthesis)
 - **partitioning** of isotopes differentially among phases
- Isotopic separation during chemical, physical, or biological processes is called **Isotope fractionation**

Usefulness of Stable Isotopes

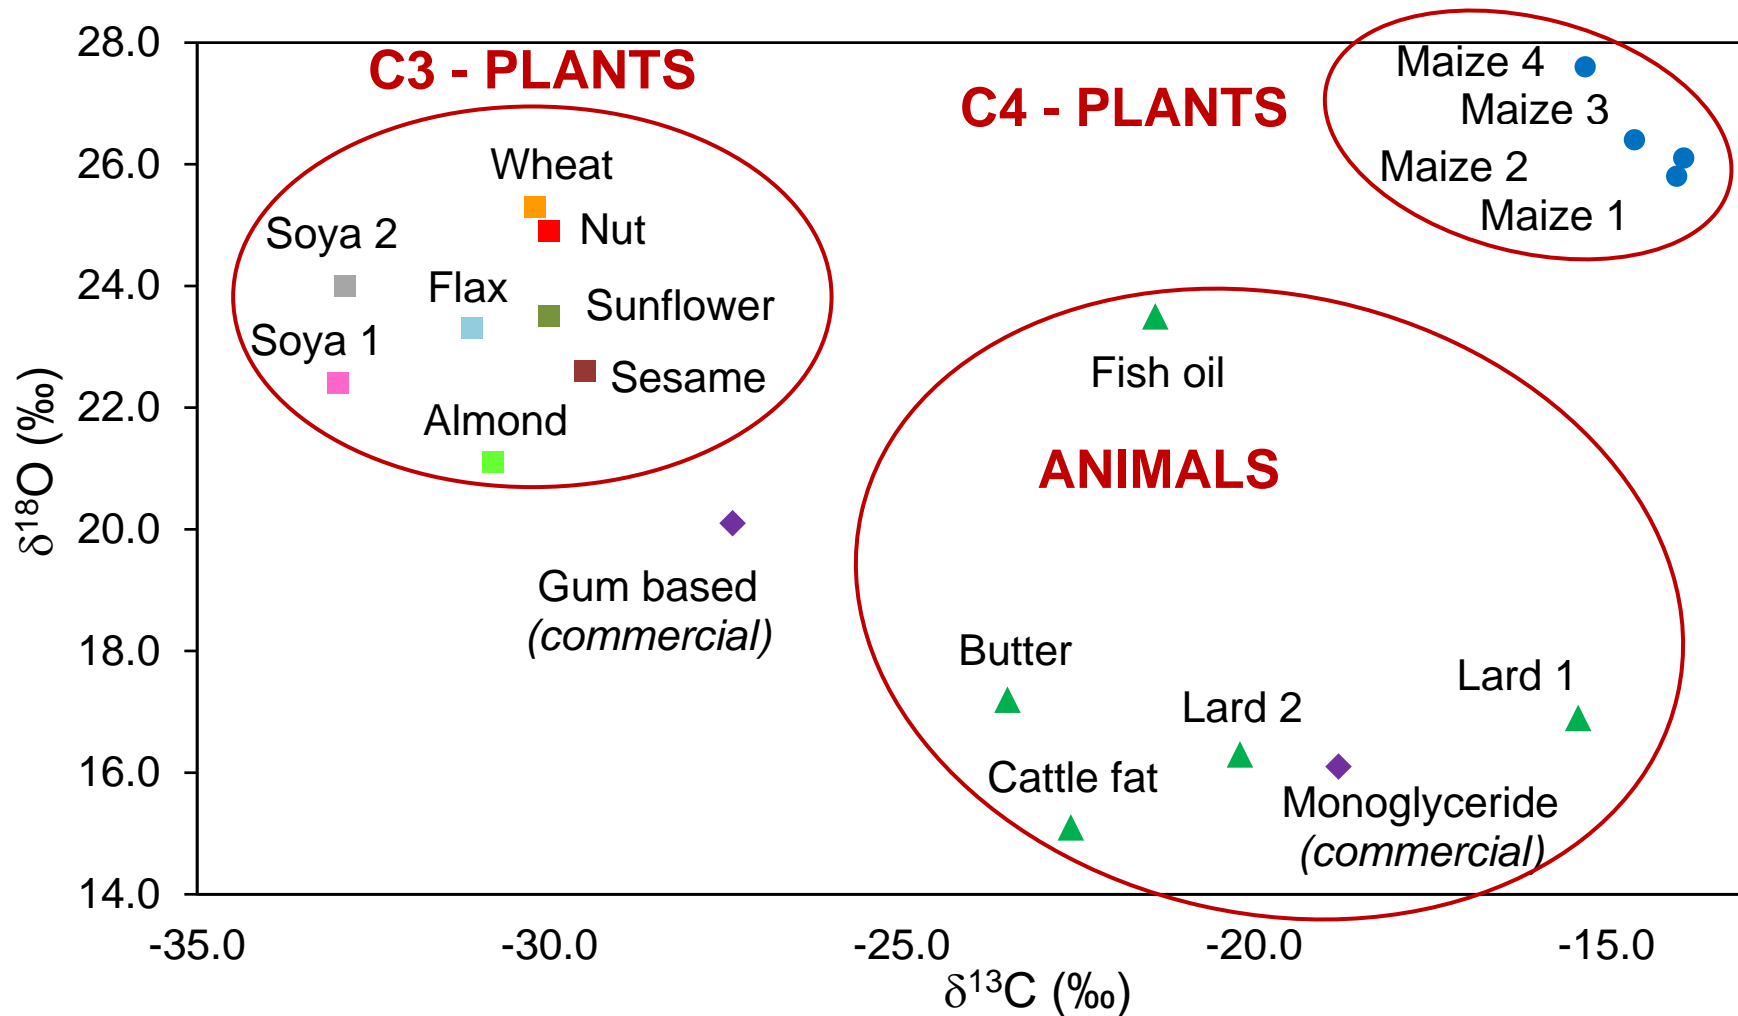

Stable Isotopes are useful as:

- **indicators** of physical or chemical (incl. biological) processes and geochemical cycles
- conservative **tracers** to identify, for example, food sources, nutrient cycling etc.

Several elements: better differentiation

Glycerol samples from fats of plant and animal origin

Isotope Ratio Mass Spectrometry (IRMS)

- **Ratios** of isotope abundances of an element in a sample are extremely small and are measured with **very high accuracy**
 - Typically light elements (traditional stable isotope systems) are used: H, C, N, O or S, but also non-traditional isotopes (Li, B, Mg, Ca, Fe, Mo, etc) can be useful in some applications

Stable isotope ratios in organic compounds:

- C ($^{13}\text{C}/^{12}\text{C}$)
- N ($^{15}\text{N}/^{14}\text{N}$)
- O ($^{18}\text{O}/^{16}\text{O}$)
- H ($^2\text{H}/^1\text{H}$)

EA-IRMS and GC-C-IRMS

(on the example of C)

Aspect	Elemental analysis isotope ratio mass spectrometry (EA-IRMS)	Gas chromatography-combustion-isotope ratio mass spectrometry (GC-C-IRMS)
Overall vs selective	A bulk measurement technique Measures average isotope ratios for the entire sample	Isotope ratios can be measured for specific compounds
Sample type	Non-volatile samples, gases, liquids, powders	Suitable for GC: volatile and thermally stable
Sample preparation	Relatively easy (homogenization, weighing and packing)	Can be work-intensive, possibly involves derivatization
Required sample amount (very approximate)	0.1 mg to hundreds of mg	Depends on the amount of organic compounds in the sample

Summary

- Natural elements are mostly **mixtures of isotopes**
- Isotope abundances of elements can vary depending on the **origin** of the material
 - Ratios of stable isotope abundances of H, C, O, N and S are the most typically used
- IRMS allows **measurements** of isotope abundances with **very high accuracy**
 - IRMS can be realised in several configurations of which two versions are most commonly used: EA-IRMS, GC-C-IRMS
